

For English, **Jaeem** wrote an excellent non-chronological report about tigers that live in a rainforest. He used excellent presentation skills, subheadings and pictures. Well done Jaeem!

Rainforest tigers 24/12/20

Introduction

There are some animals that live in Rainforest like frogs, toads, butterflies, parrots, tigers, toucans, Mammals and Sloth. But today we are going to learn about tigers. As we know about tigers, they eat Sambar deer, wild pigs, water buffalo and antelope.

Appearance

- Tigers have orange fur with black stripes
- Black stripes that extend to the white underside
- The stripes that used to keep them camouflaged
- Two tigers that have the same pattern of stripes

Habitat

Tigers are found in an amazing diverse like rainforests, grassland, savannas and even mangrove swamps. Unfortunately, 93% of historical tiger lands have disappeared primarily because of expanding human activity. Saving tigers means saving forest like Rainforest that are vital to the health of the planet. In order for the tiger to survive, they need to live in areas with vegetation, access to water and large ungulate or hoofed their prey. The exact habitats of the different species of tiger live in varies, although they generally live in rainforests.

Diet

As you can see, this animal that the tiger eat is an antelope, it may be looks like this animal is taller than tiger but with the help of the tigers

strategy, they hunted animals. Tigers eat a variety of prey ranging in size from termites to elephant calves. However, an integral component of their diet are large-bodied prey weighing about 20 kg or larger like moose, deer species, pigs, cows, horses, buggalos and goats. In the wild, a Bengal tiger can eat up to eighty pounds of meat in one night. Since only one hunt in 20 is successful, they typically go without food for several days. It takes about 5,500 pounds of meat a year to sustain a cat this large.

Conclusion

As we know about tigers all along, it started to get interesting. I learned that tigers can destroy their prey and eat animals that looks even taller than tigers. What is very important that we should not kill Rainforest animals like tigers as well as other animals that live in Rainforest. Also we should not destroy their habitat otherwise they will bear soon.
